**Event:** Heavy rain that started in December, has caused several floods in Mozambique. The event is ongoing, Copernicus EMS Rapid Mapping is requested to provide initial rough estimation and flood extent emergency mapping

**Data sources and analysis:** Pre-event image: Sentinel-2 (2025) (acquired on 26/10/2025 at 07:40 UTC resolution 10 m).  
Post-event image: TerraSAR-X (2026) (acquired on 22/01/2026 at 16:25 UTC resolution 8.2 m).  
All images are provided under COPERNICUS by the European Union and ESA, all rights reserved.

The thematic layer has been derived from post-event satellite image using a semi-automatic approach. Please be aware that the thematic accuracy might be lower in urban and forested areas due to inherent limitations of the SAR analysis technique.

The flooded area corresponds to the water observed in the most recent satellite imagery, excluding the permanent water.

An extrapolated flood extent is generated by integrating observed flood areas with a Digital Terrain Model (DTM). The model's accuracy and spatial coverage depend on DTM resolution and quality, enabling the prediction of potentially flooded areas in regions with limited visibility in imagery, such as urban and forested zones.

Map produced by e-GEOS released by e-GEOS on the 23/01/2026.
