TROPICAL CYCLONE CENTER / RSMC LA REUNION / METEO-FRANCE

BULLETIN FOR CYCLONIC ACTIVITY AND SIGNIFICANT TROPICAL WEATHER  
IN THE SOUTHWEST INDIAN OCEAN

DATE: 06/11/2025 AT 1200 UTC

PART 1: WARNING SUMMARY

Nil.

PART 2 : TROPICAL WEATHER DISCUSSION

The basin is in a Near Equatorial Trough (NET) configuration east of 70E. Convective activity is weak to moderate, particularly in the far east of the basin.

This end of the week, the crossing of a Kelvin and an equatorial Rossby waves over the eastern part of the basin is strengthening the equatorial westerly flow and the NET pattern. A low-pressure system could form over the Indonesian or Australian AoR. However, the dry phase of the MJO currently affecting our basin should generally inhibit tropical convection and limit the risk of cyclogenesis.

**Development of a tropical storm is not expected over the next 5 days.**

*NOTA BENE: The likelihood is an estimate of the chance of genesis of a moderate tropical storm over the basin within the next five days:*

*Very low: less than 10%    Moderate: 30% to 60%    Very high: over 90%*

*Low: 10% to 30%            High: 60% to 90%*

*The Southwestern Indian ocean basin extends from the Equator to 40S and from the african coastlines to 90E.*
