TROPICAL CYCLONE CENTER / RSMC LA REUNION / METEO-FRANCE

BULLETIN FOR CYCLONIC ACTIVITY AND SIGNIFICANT TROPICAL WEATHER
IN THE SOUTHWEST INDIAN OCEAN

DATE: 08/11/2025 AT 1200 UTC

PART 1: WARNING SUMMARY

Nil.

PART 2 : TROPICAL WEATHER DISCUSSION

The basin is in a Near Equatorial Trough (NET) configuration east of 70E. Convective activity is weak to moderate, particularly in the far east of the basin.

An anticyclonic Rossby wave in the northern hemisphere maintains the westward flow east of the basin in our hemisphere. However, the dry MJO conditions inhibit any attempt at cyclogenesis.

Development of a tropical storm is not expected over the next 5 days.

10-day trend :

A cyclogenesis signal is beginning to appear in the southern channel, east of Mozambique.

NOTA BENE: The likelihood is an estimate of the chance of genesis of a moderate tropical storm over the basin within the next five days:

Very low: less than 10% Moderate: 30% to 60% Very high: over 90%

Low: 10% to 30% High: 60% to 90%

The Southwestern Indian ocean basin extends from the Equator to 40S and from the african coastlines to 90E.
