BULLETIN FOR CYCLONIC ACTIVITY AND SIGNIFICANT TROPICAL WEATHER
IN THE SOUTHWEST INDIAN OCEAN

DATE: 25/11/2025 AT 1200 UTC

PART 1: WARNING SUMMARY

Nil.

PART 2 : TROPICAL WEATHER DISCUSSION

The Near Equatorial Trough (NET) is now ill-defined but still persist over the far eastern edge of the basin. There is no significant convective activity over the basin.

The low-frequency context combined with a dry phase of the MJO make cyclogenesis conditions unfavorable.

There is no risk of tropical storm development over the next 5 days.

Extended 10-day outlook: By early December, easterly wind anomalies near the equator are expected to strengthen west of the MJO's dry phase, which should continue to limit cyclogenesis potential.

NOTA BENE: The likelihood is an estimate of the chance of genesis of a moderate tropical storm over the basin within the next five days:

Very low: less than 10% Moderate: 30% to 60% Very high: over 90%

Low: 10% to 30% High: 60% to 90%

The Southwestern Indian ocean basin extends from the Equator to 40S and from the african coastlines to 90E.
