BULLETIN FOR CYCLONIC ACTIVITY AND SIGNIFICANT TROPICAL WEATHER
IN THE SOUTHWEST INDIAN OCEAN

DATE: 28/11/2025 AT 1200 UTC

PART 1: WARNING SUMMARY

Nil.

PART 2 : TROPICAL WEATHER DISCUSSION

The Near Equatorial Trough (NET) pattern is no longer present over the southwestern Indian Ocean due to the cyclonic activity in the northern hemisphere, which is deflecting the equatorial westerlies northward. Convective activity remains very weak over the basin.

Low-frequency background combined with a dry phase of the MJO favor these unfavorable condition for cyclogenesis.

There is no risk of tropical storm development over the next 5 days.

NOTA BENE: The likelihood is an estimate of the chance of genesis of a moderate tropical storm over the basin within the next five days:

Very low: less than 10% Moderate: 30% to 60% Very high: over 90%

Low: 10% to 30% High: 60% to 90%

The Southwestern Indian ocean basin extends from the Equator to 40S and from the african coastlines to 90E.
