BULLETIN FOR CYCLONIC ACTIVITY AND SIGNIFICANT TROPICAL WEATHER
IN THE SOUTHWEST INDIAN OCEAN

DATE: 03/03/2026 AT 1200 UTC

PART 1: WARNING SUMMARY

PART 2 : TROPICAL WEATHER DISCUSSION

The basin shows a Monsoon Trough (MT) pattern east of 75E. Convective activity is weak near the MT, and locally moderate northeast of the Seychelles, northeast of Madagascar and within the Mozambique Channel.

This context, currently unfavorable to cyclogenesis, is related to the presence of the MJO dry phase over our basin. With the MJO shifting eastward, the MT should also become less active in the eastern part of the basin, this week.

Development of a tropical storm is not expected for the next 5 days.

10-day outlook:

Around the 10th of March, the arrival of a strong Kelvin wave from the west could result in the return of an active Monsoon Trough to the northeast of Madagascar. In addition, a system could also enter the far east of our area from the Australian area of responsibility around or after March 10th.

NOTA BENE: The likelihood is an estimate of the chance of genesis of a moderate tropical storm over the basin within the next five days:

Very low: less than 10% Moderate: 30% to 60% Very high: over 90%

Low: 10% to 30% High: 60% to 90%

The Southwestern Indian ocean basin extends from the Equator to 40S and from the african coastlines to 90E.
